

1 LOC401317

This gene annotation is based on a cDNA clone from Homo sapiens. The gene is uncharacterized and according to UCSC situated between the first and second exon of CREB5 which both code for the UTR of only one isoforms.

The gene expression is upregulated in human 23h after infection with Ebola, while the gene is only slightly expressed in all other human samples and no homolog could be found in the bat transcriptome.
